Leishmaniasis is a zoonotic parasitic disease that is caused by different *Leishmania* species. Most cases of Leishmaniasis are reported from Afghanistan, Saudi Arabia, Algeria, Brazil, Iraq, and Iran. Antimony compounds have long been used as standard treatment and first line drugs for Leishmaniasis, but *Leishmania* species have recently acquired drug resistance. Nowadays, medicinal plants are being increasingly used to treat parasitic diseases especially Leishmaniasis. In this review, the search terms *Leishmania*, Leishmaniasis, mouse, Iran, and medicinal plants were used to retrieve publications from databases such as Scopus, Islamic World Science Citation Center, Scientific Information Database, and Magiran. According to the results of this review, nine medicinal plants, *Eucalyptus camaldulensis*, *Matricaria chamomilla*, *Cathrantus roseus*, *Echinacea purpurea*, *Lawsonia inermis*, *Artemisia sieberi*, *Berberis vulgaris*, *Allium sativum L.*, and *Lavandula spica L.* have been reported to be effective on Leishmaniasis wound in mouse model. Lawson, berberine, jatrorrhizine, colobamine, palmatine, oxyacanthine, berbamine, berulcin, magnofoline, allisin, eucalyptol, paracymene, alpaphapine, caffeic acids, alkylamides, echinacosides, glycoproteins, polysaccharide, chamazulene, pigenin, trihydroxyflavone, and patholiterin, berberrubine, flavonoid compounds, santonin, and coumarin are the active compounds of the native medicinal plants of Iran that are effective on Leishmaniasis wound.

**Introduction**

Leishmaniasis is a zoonotic parasitic disease that is caused by different *Leishmania* species [1]. The most common form of Leishmaniasis is cutaneous that is widely known as Salak in Iran [2]. Each year, around two million cases of Leishmaniasis are reported [3]. In Iran, about 15000 cases of cutaneous Leishmaniasis occur each year [4]. Depending on the type of *Leishmania* species, Leishmaniasis causes a wide spectrum of clinical manifestations [5]. Most cases of Leishmaniasis are reported from Afghanistan, Saudi Arabia, Algeria, Brazil, Iraq, and Iran [6]. Antimony compounds have long been used as standard treatment and first line drugs for Leishmaniasis. These drugs require repeated injections and therefore are not well tolerated by the patients, which is a reason for low efficiency of such drugs [7]. In the recent years, *Leishmania* species have acquired drug resistance [8,9]. Although the cause of Leishmaniasis has long been detected, there has not yet been any definite treatment for cutaneous Leishmaniasis [5].

Complementary and alternative medicine refers to those medical interventions that are not widely taught in medical schools and are not commonly accessible in hospitals [10]. Complementary and alternative medicine includes several disciplines, namely phytotherapy, message therapy, and acupuncture, most of which were derived from nations’ cultures and histories [11]. Herbal medicine and phytotherapy have long attracted public attention [12-15]. Medicinal plants represent the most important constituent of phytotherapy. Medicinal plants are those plants whose one or more organs contain active compounds [16-21]. Medicinal plants are closely linked with the history of human life. Man in all historical periods has needed medicinal plants to relieve his physical suffering, and using these plants has always been one of the effective methods of treatment [22]. Nowadays, medicinal plants are...
being increasingly used to treat parasitic diseases especially Leishmaniasis [23-26].

Materials and methods

In this review, the search terms Leishmania, Leishmaniasis, mouse, Iran, and medicinal plants were used to retrieve publications from databases such as Scopus, Islamic World Science Citation Center, Scientific Information Database, and Magiran. Then, the relevant articles were reviewed.

Results

According to the results of this review, nine medicinal plants, Eucalyptus camaldulensis, Matricaria chamomilla, Cathrantus roseus, Echinacea purpurea, Lawsonia inermis, Artemisia sieberi, Berberis vulgaris, Allium sativum L., and Lavandula spica L., have been reported to be effective on Leishmaniasis wound in mouse model (TABLE 1).

Discussion

According to the evidence on medicinal plants in Iran, E. camaldulensis, M. chamomilla, C. roseus, E. purpurea, L. inermis, A. sieberi, B. vulgaris, A. sativum, and L. spica are effective on Leishmaniasis wound. L. inermis has antimicrobial effect and its active compound is lawson [27-36]. B. vulgaris has hypotensive effect [37,38]. This plant contains berberine, jatrorrhizine, colombamine, palmitine, oxyacanthine, berbamine and magnoflorine [39,40]. A. sativum has antibacterial, antiviral, and antifungal effects [41-45]. Allicin is the main compound of A. sativum [46,47]. In

traditional medicine. *E. camaldulensis* is used to treat infection and common cold [48].

Eucalyptol, paracymene, and alpha-pinene are some of the compounds of *E. camaldulensis* [49]. *E. purpurea* exerts antioxidant effect [50,51]. This plant contains caffeic acids, alkylamides, echinacosides, glycoproteins, and polysaccharides [52]. Phytochemical investigations demonstrated that *M. chamomilla* contains chamazulene, pigenin, trihydroxyflavone and patholiterin [53]. *B. vulgaris* is rich in antioxidant compounds such as berbamine, berberine, and berberrubine [54,55]. *B. vulgaris* is used to treat diabetes and hypertension [56]. *A. sieberi* contains flavonoid compounds, santonin, and coumarin [57].

The evidence indicates that in addition to anti-worm activity, *A. sieberi* has many biological activities such as microbicidal, antifungal, virucidal, and antiparasitic. Besides that, the analgesic, antioxidant, and vasodilatory effects of this plant were confirmed [58-64].

Lawson, berberine, jatrorrhizine, colombamine, palmatine, oxyacanthine, berbamine, magnoflorine, allicin, eucalyptol, paracymene, alpha-pinene, caffeic acids, alkylamides, echinacosides, glycoproteins, polysaccharide, chamazulene, pigenin, trihydroxyflavone, sirranoside and patholiterin, berberrubine, flavonoid compounds, santonin, and coumarin are the active compounds of the native medicinal plants of Iran that are effective on Leishmaniasis wound.

The mechanism actions of the presented plants are not clearly established. Plants contain multiple compounds having antimicrobial activities for protection against microorganisms. The mechanisms actions of plant compounds in general have been attributed to various factors including disintegration in cytoplasmic membranes, electron flow, active transport and coagulation of the cell content and destabilization of proton motive force [65,66]. The most important factors responsible for antimicrobial actions are hydrophobic properties that allow lipids penetration from the bacterial cell membranes, disturbing cell structures which in turn impose more penetration [67]. They also may act on the proteins of cytoplasmic membranes or ATPase enzymes located on cytoplasmic membranes which are surrounded by lipid molecules, or cause distortion of lipid-protein interaction, or interact with hydrophobic parts of the proteins or act on the enzymes which are involved in the synthesis of microbial structural sections [68-70]. In some plants, terpenes, for example, obtained from essences have high level of antibacterial activities [65]. Phenolic compounds have been shown to mostly have antibacterial and anti-Leishmania activities. These compounds are available in a lot of plants. Hence, these herbs may also possess anti-Leishmania activities. In sum, plants have been used since ancient times by various communities for treatment various of diseases, including Leishmaniasis. Medicinal plants have the potential for the production of new drugs to be used as alternative or complementary with conventional drugs. They may decrease the costs and improve the quality of treatment.
